

Table 5 | Sensitivity of the main interpretation

Check	Specification	Result and scope	Detail
Stricter monitoring level	q95; rules unchanged	Gate advantage retained in all three combinations; dependence/priority increments unresolved	S10–S12
Process definition	0/1/2 inactive-day bridges	q90 matched gate gains 17.96–23.62 pp; point estimates descriptive	S10–S12
Temporal uncertainty	7/14/28-day blocks	Gate pointwise intervals above zero at both thresholds and in all three primary combinations	S10–S12
French timestamps	Original/–30/+30 minutes	q90 gate gain 17.02–18.25 pp on 722 common days; priority may reverse	S10.6
Danish weather input	Primary local versus fixed macro	Macro q90 gate gains 17.32/12.73 pp; primary input not selected by score	S11–S12
Added complexity	Fixed P1 on M0–M3; annual P2/P1	No stable added native early coverage from t; original priority difference +8 spells in 2024/–6 in 2025	S10.4–S12
Multiplicity	Six q90 contrasts in each named family	Gate Holm-adjusted p=0.003; t/priority not supported; post-revision check	S12
Rule parameters	Gates 0.25/0.19, cap two, cooldown six	Fixed transfer across years/thresholds/regions; no new neighbourhood optimisation or robustness claim	S10–S12
